                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a cytotoxically active CD3 specific binding construct comprises a first domain specifically binding to human CD3 and an Ig-derived second binding domain. The CD3 specific binding construct above or the construct produced by the process nucleic acid molecule, vector, or host is useful for the preparation of a pharmaceutical composition for the prevention, treatment, or amelioration of a composition for the prevention, treatment, or amelioration of a composition for the prevention, an infectious disease, an immunological disorder, an autoimmune disease, an infectious disease, viral disease, allergic reactions, parasitic reactions, graft-versus-post disease, or construct is useful for treating, preventing, or ameliorating construct is useful for treating, an inflammatory disease, an immunological disorder, an autoimmune disease, an inflammatory disease, an immunological disorder, an autoimmune disease, an inflammatory disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host disease, or host-versus-graft diseases. The present sequence represents the amino acid sequence of a non-deimmunized anti-CD3 cassette heavy chain variable

The VH sequence is one of 22 (AAR21264-85) expressed from a single chain for library. The library produces a diverse repertoire of antibody fragments specific for 2-phenyl-5-oxazolone (phox). It was prepd. using CDNA generated from mRNA from mice immunised with phox coupled to chicked serum albumin. The VH and VL kappa sequences were separately amplified by CSC (AACA2144-84) and ligated into fdCAPT (AAC31463) for expression on the phage surface as fusions with gene III. The resulting library of clones was diverse; 23 hapten binding clones were sequenced revealing 8 VH genes (A-H; AAR21264-71) in a variety of pairings with 7 VK genes (a-Gross as equenced. 13 new patrners (AACA2146-95). Most clones were recented for hapten binding and 24 clones sequenced. 13 new patrners (AAR21272-85) for VK-d were identified. Nearty all the VH genes belonged to gp 1, with only one, "E", being of gp (VH-B/VK-d for phox-GABA was 10 nM, one of the highest values found. This suggests that phage bearing scFV fragments having weak affinit. ies can be selected with antigen, probably due to the avidity of the multiple antibody heads on the phage. The different combinations could also be

New humanised antibodies comprising CDR grafted antibody - with heavy and
light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT antibody heavy chain (see features). New humanised antibodies comprising CDR grafted antibody - with heavy and light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                 It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AAQ12636-7 and AAR13092-R13109. NOTE: Data found in patent W09109968 has been used to index this entry. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                 This is an example of a CDR-grafted heavy chain region of the invention.
                                                                                                                                                           Example 15; Fig 5; 91pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 119 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AQ12636-7 and AAR13092-R13109. NOTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New humanised antibodies comprising CDR grafted antibody - with heavy and light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                       humanised antibody; CDR graft; heavy chain variable region; mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /label= from OKT3 heavy chain

     ò
```

```
New humanised antibodies comprising CDR grafted antibody - with heavy and light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AAQ12636-7 and AAR13092-R13109. NOTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                             humanised antibody; CDR graft; heavy chain variable region; mouse.
                                                                                                                                                                                                                                               48. .66
|Jabel= from OKT3 heavy chain
|note= "Val(64) is from KOL sequence"
                                                                                                                                                                                                                                                                                                                                                                                                    /label= OKT 3 heavy chain residue 99. .106

New humanised antibodies comprising CDR grafted antibody - with heavy and
light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is an example of a CDR-grafted heavy chain region of the invention.
It comprises the human KOL heavy chain sequence except where certain

This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AAQ12636-7 and AAR13092-R13109. NOTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 09-UAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

New humanised antibodies comprising CDR grafted antibody - with heavy and
light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                     This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AAQ12636-7 and AAR13092-R13109. NOTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                humanised antibody; CDR graft; heavy chain variable region; mouse.
                                                                                                                                                                                                                                                                                                                                                                      2; Length 119;
                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            'label= OKT 3 heavy chain residue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AAQ12636-7 and AAR13092-R13109, NOTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
               New humanised antibodies comprising CDR grafted antibody - with heavy and
light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     humanised antibody; CDR graft; heavy chain variable region; mouse.

The anti-human CD3 mouse monoclonal antibody OKT3 (IgG2a) can be engineered to contain a human Fc region. By transferring the binding specificity into a human framework, the immunoganicity is reduced without affecting the immunosuppressive activity. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                   New humanised OKT3 antibody with mutated Fc receptor binding region - useful as immunosuppressant to reduce transplant rejection, lacks the T-cell activating side effects of wild type antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OKT3; humanized antibody; 3C10; antibody engineering; immunosuppressive;

                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                               This is an example of a CDR-grafted heavy chain region of the invention. It comprises the human KOL heavy chain sequence except where certain regions have been replaced by corresponding regions from the murine OKT3 antibody heavy chain (see features). See AAQ12636-7 and AAR13092-R13109. ONTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                    New humanised antibodies comprising CDR grafted antibody - with heavy and light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               OKT3; humanized antibody; 3C10; antibody engineering; immunosuppressive;

The anti-human CD3 mouse monoclonal antibody OKT3 (IgG2a) can be engineered to contain a human Fc region. By transferring the binding specificity into a human framework, the immunogenicity is reduced without affecting the immunosuppressive activity. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating mammalian immune system e.g. in tissue transplants - using Fc receptor non-binding anti-CD3 antibodies that inactivate Th1 and promote Th2 type T cells.
                                                                                                                                                                                                               New humanised OKT3 antibody with mutated Fc receptor binding region - useful as immunosuppressant to reduce transplant rejection, lacks the T-cell activating side effects of wild type antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a humanised variable region of OKT3. The OKT3 sequence can be used in the method of the invention. The method is for modulating the immune system of a mammal, and comprises obtaining an immunomodulatory compound that selectively induces theta chain tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OKT3; variable region; immune system modulator; theta chain; infection; T-cell receptor; TCR complex; ZAP-70; tyrosine kinase; human; cancer; haematopoietic tissue transplant; autoimmune disease; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                engineered to contain a human Fc region. By transferring the binding specificity into a human framework, the immunogenicity is reduced without affecting the immunosuppressive activity. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                             New humanised OKT3 antibody with mutated Fc receptor binding region - useful as immunosuppressant to reduce transplant rejection, lacks the T-cell activating side effects of wild type antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    OKT3; humanized antibody; 3C10; antibody engineering; immunosuppressive;

This invention relates to the novel anti-CD3 monoclonal antibody heavy chain and light chain variable-area and the encoded proteins thereof. Specifically, it refers to using these genes and polypoptides for the preparation of medicines for the diagnosis and treatment of tumor growth. The present invention further describes the development of composition that can be used to inhibit immunological rejection during organ transplantation i.e. graft versus host disease. Accordingly, these compositions exhibit immunosuppressive and cytostatic activities. This polypeptide sequence is the anti-CD3 monoclonal antibody heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD3-resisting single clone antibody heavy-chain and light-chain variable-
area gene, useful for treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                           CD3; tumor suppressor; organ transplant rejections; immunosuppressive;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                   ö
phosphorylation of a p21 form of theta of the T-cell receptor (TCR) complex without induction of the highly phosphorylated form of theta and triggers ZAP-70 association, but does not induce tyrosine phosphorylation of associated ZAP-70 tyrosine kinase. The immunomodulatory compound is then combined in a pharmaceutically acceptable vehicle and administered to the mammal. The method is used to modulate the immune system in a human receiving haematopoietic tissue transplant. It can also be used in the treatment of diseases such as an autoimmune disease, an infection cancer, or other malignancy or immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a humanised variable region of OKT3. The OKT3 sequence can be used in the method of the invention. The method is for modulating the immune system of a mammal, and comprises obtaining an immunomodulatory compound that selectively induces theta chain tyrosine phosphorylation of a p21 form of theta of the T-cell receptor (TCR) complex without induction of the highly phosphorylated form of theta and triggers ZAP-70 association, but does not induce tyrosine phosphorylation of associated ZAP-70 tyrosine kinase. The immunomodulatory compound is then combined in a pharmaceutically acceptable vehicle and administered to the mammal. The method is used to modulate the immune system in a human receiving haematopoletic tissue transplant. It can also be used in the treatment of diseases such as an autolimmune disease, an infection cancer, or other malignancy or immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modulating mammalian immune system e.g. in tissue transplants - using Fc receptor non-binding anti-CD3 antibodies that inactivate Th1 and promote Th2 type T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 OKT3; variable region; immune system modulator; theta chain; infection; T-cell receptor; TCR complex; ZAP-70; tyrosine kinase; human; cancer; haematopoietic tissue transplant; autoimmune disease; therapy.
                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ଚ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated mammalian anti-dual integrin antibody having at least one of the human heavy chain or light chain complementary determining region (CDR, HC CDR1-CDR3, LC CDR1-3). Also included are the nucleic acids endergo compressing the complementary determining region (CDR, HC CDR1-CDR3, LC CDR1-3). Also concluded are the nucleic acids a host cell comprising the vector comprising the nucleic acids, a host cell comprising the vector, an anti-idiotype contibody that binds to the ant-dual integrin, a medical device comprising the antibody sultable for administration by parenteral, subcutaneous, intraduceduar, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, intravenous, antravenous, intravenous, intervenous, intravenous, intervenous, intravenous, intervenous, intervenous, intravenous, intervenous, intravenous, intervenous, intravenous, intervenous, intravenous, intravenous, intravenous, intravenous, intravenous, intervenous, inte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated mammalian anti-dual integrin antibody, useful for diagnosing or treating dual integrin related condition such as rheumatoid arthritis, gastric ulcer, asthma, atherosclerosis, restenosis.

The invention comprises an anti-ovarian cancer bispecific antibody. The bispecific antibody of the invention contains an anti-ovarian cancer antibody region and an anti-CD3 antibody region. The antibody of the invention is useful for treating tumours, particularly ovarian cancer. The present amino acid sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CDR3; antinflammatory; antimicrobial; cytostatic; immunomodulator; immunouppressive; proliferative disease; tumour; inflammatory disease; immunological disorder; autoimmune disease; infectious disease; OKT3; heavy chân variable region; antibody.

                                                                                                                                                                                 The invention relates to a novel polypeptide construct comprising at least one CDR3 region comprising at least one mutation in a fully defined sequence of 6 amino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an immunological disorder, an autoimmune disease or an infectious disease, an immunological disorder, an autoimmune the OKT3 antibody heavy chain variable region without the signal peptide.

                                                                                                                                           a first specificity with respect to a human spithelial cell growth factor receptor (HBR) and a second specificity with respect to the surface antigen expressed in a cell having phagocytosis or cell damage activity. The invention may be useful for the production of compounds with a cytostatic activity. Hence it is useful in cancer immunotherapy as an anti-tumour agent. The antibody increases cytokine production in a cell having phagocytic or cell-damage activity. The invention may be useful in preparing pharmaceutical composition for excluding, for killing or harming, for traumatising and/or decreasing tumour cells. The antibody exhibits an excellent in vivo cell damage activity and has the advantage that it maintains its activity and exhibits outstanding stability even when preserved for several months. The present sequence is that of the humanised OKT3 antibody VH chain and which was used in the
                                                                                                invention relates to a novel diabody type bispecific antibody having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

The invention relates to a substance (I) specific to human PD-1, a region recognizing a momental a region recognizing human PD-1, a region recognizing a comprising a region recognizing human PD-1, a region recognizing a membrane protein existency in cytoplasmic membrane in which human PD-1 is expressed, and a linker. Also disclosed are: (a) a bispecific antibody (II) comprising an antibody with respect to human PD-1 or its partial fragment, and antibody with respect to be cell receptor composition the partial fragment and a linker; (b) a polypebilde (III) comprising the antibody with respect to busin PD-1, and comprising a sequence in which to antibody with respect to human PD-1, and comprising a sequence in which consisting of (IV); and (e) a host cell (VI) transformed by (V). (I) is consisting of (IV); and (e) a host cell (VI) transformed by (V). (I) is consisting of (IV); and (e) a host cell (VI) transformed by (V). (I) is consisting of (IV); and (e) a host cell (VI) transformed by (V). (I) is consistent as a pharmaceutical composition for preventing or treating a concerned in human PD-1, such as neurodegenerative disease chosen from senile dementia, Alzheimer's disease, Down's syndrome, classes, cutoimmune disease, anyotrophic lateral sclerosis, disease, autoimmune disease chosen from glomeral context dermatitis, arthritis, cutling and disease, systemic lupus erythematosus, rheumatoid arthritis, multiple sclerosis, dry bright, allergic context dermatitis, multiple context disease, permitions ansemia, context dermatitis, multiple sclerosis, insulin-dependent diabetes membrane permitions ansemia, context dermatitis, multiple sclerosis, disease, disease, permitions ansemia, autoimmune thrombocycopenic purpura, autoimmune haemolytic ansemia, andimia, This sequence corresponds to a bispecific antibody targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                 Substance specific to human PD-1, comprises region recognizing human PD-1, region recognizing membrane protein existing in cytoplasmic membrane expressing human PD-1, and linker.

                                                                                                                                                                                                                                                                                             The invention comprises a composition that contains a bispecific single chain antibody consisting of at least two domains, where one of domains binds to human epithelial cell adhesion molecule (EpCAM) antigen, and the second domain binds to human CD3 antigen. The bispecific antibody construct of the invention is useful for the prevention, treatment or amelioration of a tumorous disease, such as an epithelial or minimal residual cancer. The present amino acid sequence represents an antibody heavy chain variable domain that is specific for the CD3 antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New pharmaceutical composition having a bispecific single chain antibody construct, useful for preventing, treating or ameliorating a tumorous

The invention relates to a de-immunized anti-CD3 antibody. The antibody, composition and methods are useful for stimulating an immune response against infections and for treating infections. The present sequence represents the amino acid sequence of a mouse OKT3 deimmunized VH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New de-immunized anti-CD3 antibody, useful for stimulating an immune response against infections and for treating infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                               The invention comprises a composition that contains a bispecific single chain antibody consisting of at least two domains, where one of domains binds to human epithelial cell adhesion molecule (EpcAM) antigen, and the second domain binds to human CD3 antigen. The bispecific antibody construct of the invention is useful for the prevention, treatment or amelioration of a tumorous disease, such as an epithelial or minimal residual cancer. The present amino acid sequence represents an antibody heavy chain variable domain that is specific for the CD3 antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibody,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a de-immunized anti-CD3 antibody. The antiboc composition and methods are useful for stimulating an immune response against infections and for treating infections. The present sequence represents the amino acid sequence of a mouse OKT3 VH procein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                              The invention relates to a de-immunized anti-CD3 antibody. The antibody, composition and methods are useful for stimulating an immune response against infections and for treating infections. The present sequence represents the amino acid sequence of a mouse OKT3 deimmunized VH
                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                    New de-immunized anti-CD3 antibody, useful for stimulating an immune response against infections and for treating infections.

Sequence 19, Application US/08116247

Patent No. 5929212

GENERAL INFORMATION:
APPLICANT: Joinffee, Linda K.
APPLICANT: Achair, John R.
APPLICANT: Achwal, Dilject S.
ITILE OF INVENTION: CD3 Specific Recombinant Antibody
NUMBER OF SEQUENCES: 29
CORRESPONDENCE ADDRESS:
ADDRESSEE: Woodcock Wasburn Kurtz Mackiewicz & No. 5929212ris
STREET: One Liberty Place - 46th Floor
CITY: Philadelphia
STREET: Achair Paid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-08-587-050-10

Sequence 10. Application US/08557050

Petent No. 6491916

GENERAL INFORMATION:
APPLICANT: Bluestone, Jeffrey A.
APPLICANT: Alvin, Robert A.
TITLE OF INVENTION: METHODS AND MATERIALS FOR MODULATION OF
TITLE OF INVENTION: THE IMMUNO-SUPPRESSIVE ACTIVITY AND TOXICITY OF MONOCLONAL
TITLE OF INVENTION: THE IMMUNO-SUPPRESSIVE ACTIVITY AND TOXICITY OF MONOCLONAL
TITLE OF INVENTION: THE IMMUNO-SUPPRESSIVE ACTIVITY AND TOXICITY OF MONOCLONAL
